

# ABSTRACT

A golf practising device includes a base, a number of sensors disposed along the base for sensing a movement of the ball along the base, a displayer device, and a processor device coupled to the sensors for receiving signals from the sensors and for treating the signals from the sensors and for sending treated signals to the displayer device and to be displayed on the displayer device. One or more fences are disposed on the sides of the base, and a housing disposed on the other end of the base for supporting the sensors. The fences each includes a number of bars secured together.
